Tales of Life as a Marine Scientist on the High Seas

Adrienne Oakley, Ph.D., University of Hawaii

Tuesday September 9, 2008, 7-8 pm

Boehm Science Building Room 145

Adrienne Oakley is a marine geophysicist who studies the rocks that lie beneath the deepest part of the ocean – the Mariana Trench in the southwest Pacific. Traveling aboard scientific research vessels in open, blue water, she thumps the earth with penetrating seismic waves like a colossal ultrasound to image the oceanic crust. Raised in rural Connecticut, she now lives in Mānoa, Hawaii. She has published scientific papers in several highly reputable international journals and is an award-winning member of both the American Geophysical Union and the Geological Society of America.

She is coming to speak to the Kutztown community to share stories of her travels and adventures as a researcher on the high seas. **Everyone is welcome!**
