

## JavaScript Arrays Assignment

You are to modify your main index.html page (NOT your project page) as follows:

- Create an array that contains your five favorite things, such as sports teams, bands, or movies
  - Do NOT put these elements in the array in sorted order – be sure they are unsorted alphabetically
- Print your five favorites to your web page in sorted order using a loop statement.

You must write a function to do the processing and then just put the function call in the body of your web page.

You can display this anywhere on your index.html web page. Be sure to use a loop statement to print all the array element.

You do not have to turn anything in for this assignment, simply update your index.html page with the appropriate JavaScript code.
