

Network Programming

Program Security

Note: This class lecture will be recorded!

If you do not consent to this recording, please do not ask questions via your video, audio or public chat; send your question to the instructor using the private chat.

Lisa Frye, Instructor

frye@Kutztown.edu

Kutztown University

Secure Program

- ▶ What is meant by the statement “Program x is secure”?
- ▶ Software Quality
- ▶ Program Faults

Which one is more Secure?

- ▶ 100 faults were discovered and fixed
- ▶ 20 faults were discovered and fixed

IEEE Terminology

- ▶ IEEE has a standard for software engineering terminology (610.12, 1990)
- ▶ **Quality** - The degree to which a system, component, or process meets specified requirements
- ▶ **Failure** - The inability of a system or component to perform its required functions within specified performance requirements
- ▶ **Fault** - An incorrect step, process, or data definition in a computer program

Software Quality Control

- ▶ Software Quality Assurance (SQA)
- ▶ Secure Software Development
 - ▶ Secure SDLC
- ▶ Software Reverse Engineering
 - ▶ What is it?
 - ▶ Benefits?
- ▶ Whose responsibility is to ensure software is secure in a corporate setting?

OWASP

- ▶ <https://www.owasp.org/>
- ▶ https://www.owasp.org/index.php/Category:OWASP_Top_Ten_Project

- ▶ 2019 Top Five
- ▶ 2017
- ▶ 2013

Program Patches

- ▶ *Penetrate and Patch* paradigm
- ▶ Program patches often led to a less secure program.
- ▶ Why?
 - ▶ Pressure to correct quickly
 - ▶ Nonobvious side effects
 - ▶ Performance consequences

Program Flaws

- ▶ Requirements vs. actual behavior
- ▶ *Program security flaw*

- ▶ Vulnerabilities and Flaws Views
 - ▶ Cause
 - ▶ Effect

- ▶ Patching and Analyzing program behavior are not always the best approach

Taxonomy of Program Flaws

- ▶ Inadvertent human errors
 - ▶ Malicious, intentionally introduced flaws
 - ▶ Malicious
 - ▶ Non-Malicious
 - ▶ Covert channel
 - ▶ Other
- ❖ What types of program flaws do you think cause more damage?

Inadvertent Flaws

- ▶ Validation error (incomplete or inconsistent)
- ▶ Domain error
- ▶ Serialization and aliasing
- ▶ Inadequate identification and authentication
- ▶ Boundary condition violation
- ▶ Other exploitable logic errors

Buffer Overflow

- ▶ Buffer
- ▶ Buffer Overflow

- ▶ `char buf[10];`
 `buf[10] = 'A';`
- ▶ `char *buf;`

Buffer Overflow Example

- ▶ 8-byte string (empty) and 2-byte integer (3)

A	A	A	A	A	A	A	A	B	B
0	0	0	0	0	0	0	0	0	3

A	A	A	A	A	A	A	A	B	B
'e'	'x'	'c'	'e'	's'	's'	'i'	'v'	'e'	0

Another Buffer Overflow Example

```
char sample[10];  
for (i=0; i<10; i++) sample[i] = 'A';  
sample[10] = 'B';
```

► Where does the last assignment ('B') go?

From: "Security in Computing", chapter 3, by Pfleeger and Pfleeger

Dr. L. Frye

Stack-Based Buffer Overflow Example

Stack-Based Buffer Overflows

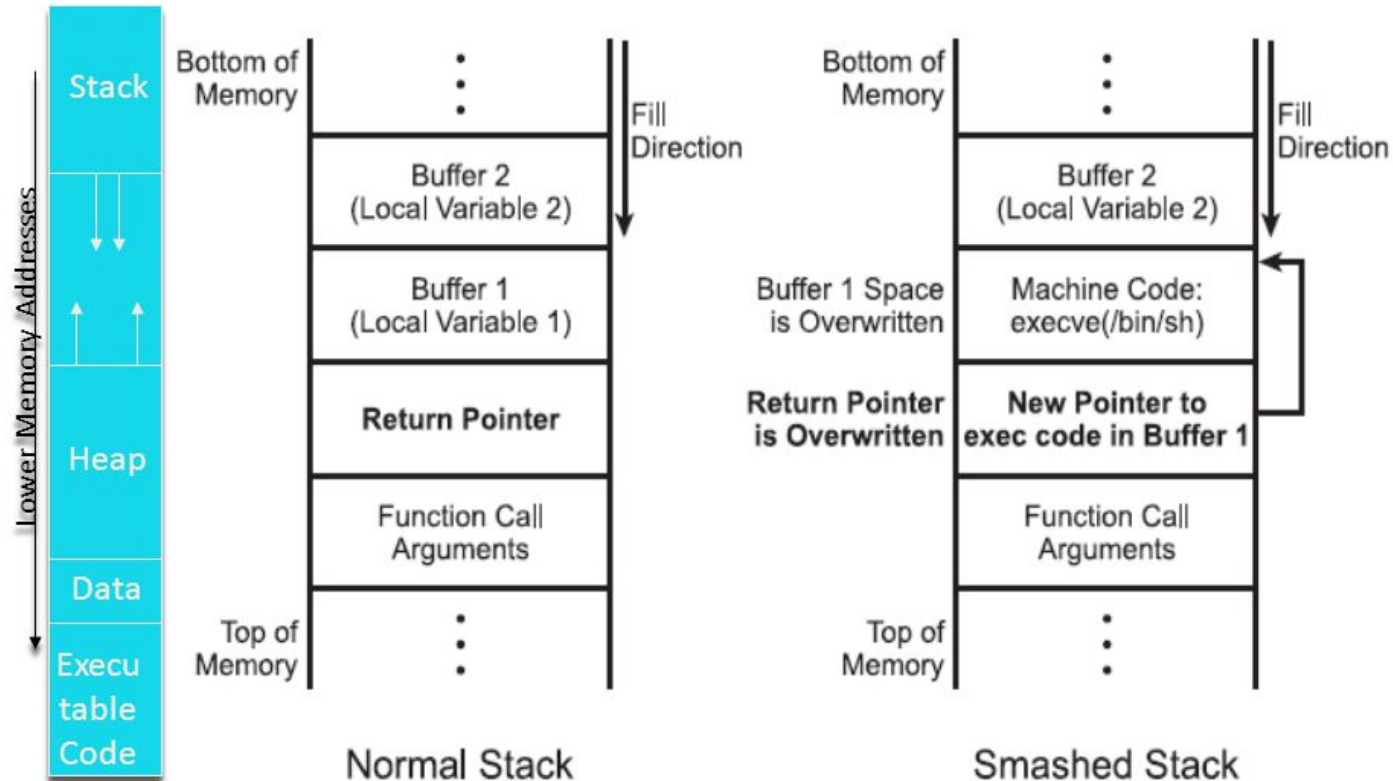

EXHIBIT 10.2 A normal stack and a stack with a buffer overflow.

C String Functions

- ▶ strcpy
- ▶ Strncpy

Common C string functions to use and avoid	
Don't use these functions	Use these instead
strcat	strlcat
strcpy	strncpy
strncat	strlcat
strncpy	strncpy
sprintf	<u>snprintf</u> (see note) or <u>asprintf</u>
vsprintf	<u>vsnprintf</u> (see note) or <u>vasprintf</u>
gets	<u>fgets</u> (see note) or use Core Foundation or Foundation APIs

Preventing & Detecting Buffer Overflow

- ▶ Address Space Layout Randomization (ASLR)
- ▶ No stack or heap execution

- ▶ Test your Programs!!!

Buffer Underflow

- ▶ What is Buffer Underflow
- ▶ Is this a problem (is it dangerous)?
- ▶ Two Types
 - ▶ Short Write
 - ▶ Short Read
- ▶ CVE - Common Vulnerabilities and Exposures

CVE - Common Vulnerabilities and Exposures

▶ <https://cve.mitre.org>

▶ CVE Details

▶ <https://www.cvedetails.com/index.php>

▶ OpenSSL Vulnerabilities

▶ https://www.cvedetails.com/vulnerability-list.php?vendor_id=217&product_id=0&version_id=0&page=1&hasexp=0&opdos=0&opecc=0&opov=0&opcsrf=0&opgpriv=0&opsqli=0&opxss=0&opdir=0&opmemc=0&ophttps=0&opbyp=0&opfileinc=0&opginf=0&cvssscoremin=0&cvssscoremax=0&year=0&month=0&cweid=0&order=3&trc=85&sha=d709ee3c0dc47c3827b5990023842398148d082b

Underflow Error

- ▶ What is an underflow error?
- ▶ <http://hmarco.org/bugs/CVE-2015-8370-Grub2-authentication-bypass.html>

Unchecked Data Values

- ▶ <http://www.somesite.com/page/userinput¶m=2004Jun1>
- ▶ Possible values for param
 - ▶ 2004Jun1
 - ▶ 1800Jan1
 - ▶ 2015Feb30
 - ▶ 2000Min5
- ▶ What would be the results of these input values?

Security Implications - Example

- ▶ Things, Inc. - very large, international vendor of consumer products: Objects
- ▶ The company was ready to sell its Objects through a web site
- ▶ To Things developed a complete price list of its Objects
- ▶ For example, a customer on the web could choose to buy 20 of part number 555A Objects. If the price of one such part were \$10, the web server would correctly compute the price of the 20 parts to be \$200.
- ▶ Then the customer could decide whether to have the Objects shipped by boat, by ground transportation, or sent electronically.
- ▶ `http://www.things.com/order/final&custID=101&part=555A&qy=20&price=10&ship=boat&shipcost=5&total=205`

Security Flaw in Example

- ▶ What is the security flaw in the Things, Inc. example?

- ▶ `http://www.things.com/order/final&custID=101&part=555A&qy=20&price=1&ship=boat&shipcost=5&total`

SQL Injection

► What is SQL Injection?

<http://xkcd.com/327>

SQL Injection Example 1

- ▶ `userID = getRequestString("UserId");`
`SQL = "SELECT * FROM Users WHERE UserID = " + userID`
- ▶ User enters 'frye'
- ▶ User enters 'asdf or 1=1'

SQL Injection Example 2

- ▶ `productID = getQueryString("ProductID");`
`SQL = "SELECT * from Products Where ProductID = " + productID;`
- ▶ User enters 'abc'
- ▶ User enters 'abc; DROP TABLE Products'

SQL Injection Example 3

```
$sql = "INSERT INTO Customers " .  
      "(Email, Passwd, FirstName, LastName, Address1, "  
      "Address2, City, State, ZipCode, PhoneNumber) "  
      "VALUES (" . $_POST['email'] . ", "  
              $_POST['password'] . ", "  
              $_POST['fname'] . ", "  
              $_POST['lname'] . ", "  
              $_POST['street'] . ", "  
              $_POST['street2'] . ", "  
              $_POST['city'] . ", "  
              $_POST['state'] . ", "  
              $_POST['zip'] . ", "  
              $phone . ")";  
$result = mysql_query($sql);
```

Example 3 Data Input

- ▶ INSERT INTO Customers (Email, Passwd, FirstName, LastName, Address1, Address2, City, State, ZipCode, PhoneNumber) VALUES ('I', 'Got', 'You', 'Good', ':)', ',':)); TRUNCATE TABLE Customers; \",':)',':)',")

- ▶ What was the result?

Design SQL Injection Prevention Code

- ▶ `userID = getQueryString("UserId");`
`SQL = "SELECT * FROM Users WHERE UserID = " + userID`

- ▶ `productID = getQueryString("ProductID");`
`SQL = "SELECT * from Products Where ProductID = " + productID;`

Prevent SQL Injection

- ▶ Blacklist

- ▶ SQL Parameters

- ▶ Values added to SQL query at execution

- ▶ @

- ▶ `userID = getRequestString("UserId");`
`SQL = "SELECT * FROM Users WHERE userID = @0";`
`db.Execute(SQL, userID);`

SQL Parameters Example

```
▶ txtNam = getRequestString("CustomerName");  
txtAdd = getRequestString("Address");  
txtCit = getRequestString("City");  
txtSQL = "INSERT INTO Customers  
        (CustomerName,Address,City) Values(@0,@1,@2)";  
db.Execute(txtSQL,txtNam,txtAdd,txtCit);
```

From W3 Schools (http://www.w3schools.com/sql/sql_injection.asp)

Other Program Threats

- ▶ Trapdoor
- ▶ Salami Attack
- ▶ Covert Channels

Controls Against Program Threats

- ▶ Peer reviews
- ▶ Encapsulation and Information Hiding
- ▶ Independent Testing
- ▶ Configuration Management
