Kutztown University

# Race Condition

- ▶ Output depends on the sequence of events.
- ▶ The system's or software's behavior is dependent on the sequence or timing of events.
- ▶ A situation in concurrent programming where two concurrent threads or processes compete for a resource and the resulting final state depends on who gets the resource first.

# Example

- ▶ Couple wants to deposit and withdraw money from a shared checking account during lunch.
- ▶ Unordered list of events
  - ▶ Wife: deposit \$500
  - ▶ Husband: withdraw \$400
  - ▶ Original balance: \$200

# Husband gets to ATM first

- ▶ Insufficient funds !!

# Wife gets to ATM first

- ▶ Balance: \$200
- ▶ Wife deposits \$500
- ▶ Balance: \$700
- ▶ Husband withdraws \$400 successfully!

# Programming Example

- ▶ read the value of  $x$  from a file or DB
  - ▶ Current value is 10
- ▶  $x = x + 5$
- ▶ print  $x$

# Processes run Sequentially

Process A

read x

10

$x = x + 5$

15

print 15

Process B

read x

15

$x = x + 5$

20

print 20

# Processes run Concurrently

Process A

read x

10

$x = x + 5$

15

print 15

Process B

read x

10

$x = x + 5$

15

print 15

# Solutions

- ▶ Locks - Mutual Exclusion

- ▶ Read

- ▶ Write

- ▶ Deadlock

- ▶ Atomic Operation

- ▶ Other threads see it as happening simultaneously

- ▶ No other thread will see the operation in a partially-completed state

- ▶ No context switch in the middle

# Programming Example

- ▶ Begin Atomic Operation
- ▶ read the value of  $x$
- ▶  $x = x + 5$
- ▶ End Atomic Operation
- ▶ print  $x$

# Summary - Race Condition
