Drawings

Drawing 1: Show the progression of one sort as it sorts and processes duplicates

WordRec Input File Whale Pony Cat token Cat Bear Dog count Pony Llama Pony Data: WordRec wordlist[5]; First, read until capacity wordList numWords: 5

| 0 | 1 | 2 | 3 | 4 |
|-------|------|-----|-----|------|
| Whale | Pony | Cat | Cat | Bear |
| 1 | 1 | 1 | 1 | 1 |

Sort: spot: 0 idxMin: 4 Swap Whale with Bear wordList numWords: 5 Whal Bear Pony Cat Cat BearWhale

Bear is settled. spot: 1 idxMin: 2

Swap first Cat and Pony (Cat goes next)

| wordList | numWords: 5 | | | | |
|----------|-------------|------|-----|-------|--|
| 0 | 1 | 2 | 3 | 4 | |
| Bear | Cat | Pony | Cat | Whale | |
| 1 | 1 | 1 | 1 | 1 | |

Cat in index 3 is next. But, it is a duplicate idxMin: 3 This is determined by wordlist[idxMin]==wordlist[spot-1]. This must <u>be c</u>hecked **before** checking wordList[idxMin] against wordList[spot]. Swap the duplicate with the last in-use element (Whale in index numWords-1), then decrement numWords. Finally, increment the duplicate word's counter. wordList numWords 0 1 2 Remains Whale Cat Pony Bear Cat Cat Whale In Use Not In Use idxMin: 2

wordList[idxMin]!=wordList[spot-1], so no duplicate. idxMin==spot, so no swap. Pony stays.

| | In Use | e | | Not In Use |
|----------|--------|------|--------|---------------|
| 1 | 2 | 1 | 1 | 1 |
| Bear | Cat | Pony | Whale | Cat |
| | | | | |
| wordList | | | numWor | ds i 4 |

Spot becomes 3, which is items -1. The loop is done. At this point, all but the last element has been processed, which means the list is ordered. Check for last element duplicate finds none. This sort is done. What would be the final result after processing this entire data file?

This Example Demonstrates a Special Case of the Duplicate at the End

WordRec Input File Whale Pony Cat token Bear Pony Dog count Pony Llama Pony Data: WordRec wordlist[5]; First, read until capacity wordList numWords: 5 2 1 0 Whale Pony Cat Bear Pony Sort: spot: 0 idxMin: 3 Swap Whale with Bear wordList numWords: 5 BearWhale Wha Bear Pony Cat Pony Bear is settled. spot: 1 idxMin: 2 Swap Cat and Pory (Cat goes in wordList numWords: 5 0 3 Whale Pony Bear Cat Pony No swap. Pony (1st one) is in place spot: 2 idxMin: 2 wordListnumWords: 5 0 Bear Cat Pony Whale Pony

spot: 3 idxMin: 4

Next item is Pony. But wordlist[idxMin] == wordlist[spot-1] → we have a duplicate
Rather than swap, we increment list[spot-1]'s count, keep spot at 3,increment list[spot-1].count,
and decrement numWords

| wordList | | | numWor | ds 4 |
|----------|-------|------|--------|-------------|
| 0 | 1 | 2 | 3 | 4 |
| Bear | Cat | Pony | Whale | Pony |
| 1 | 1 | 2 | 1 | 1 |
| | In Us | e | | Not In Use |

Spot is now 3, which is equal to items -1. The loop is done. At this point, all but the last element has been processed, which means the list is ordered.

You must add in a check if the last item is a duplicate (see next example).

Drawings

This Example Demonstrates Another Special Case

WordRec

Input File – Updated

Horse Pony Cat Pony Bear Dog Pony Llama

Data: WordRec wordlist[5];

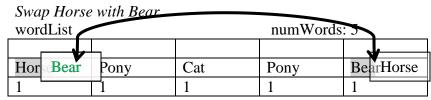

First, read until capacity

wordList

| numWords: 5 |
|-------------|
|-------------|

| 0 | 1 | 2 | 3 | 4 |
|-------|------|-----|------|------|
| Horse | Pony | Cat | Pony | Bear |
| 1 | 1 | 1 | 1 | 1 |

Sort:

Bear is settled.

Swap Cat and Pony (Cat goes next)

wordList

| mum Wanda. | _ |
|------------|---|
| numWords: | • |
| | |

| 0 | 1 | 2 | 3 | 4 |
|------|-----|------|------|-------|
| Bear | Cat | Pony | Pony | Horse |
| 1 | 1 | 1 | 1 | 1 |

Swap Horse and Pony

wordList

| | | TT | 7 | rds | | _ |
|----|----|------|-------------|-----|---|---|
| nı | ım | 1 \A | $^{\prime}$ | rac | • | _ |
| | | | | | | |

| 0 | 1 | 2 | 3 | 4 |
|------|-----|-------|------|------|
| Bear | Cat | Horse | Pony | Pony |
| 1 | 1 | 1 | 1 | 1 |

No swap. Pony (1st one) is in place

wordList

| num | W | ords | s: | 5 |
|-----|---|------|----|---|
| | | | | |

| 0 | 1 | 2 | 3 | 4 |
|------|-----|-------|------|------|
| Bear | Cat | Horse | Pony | Pony |
| 1 | 1 | 1 | 1 | 1 |

At this point, the list is **definitely** ordered. You must add in a check if the last item is a duplicate. Pony is a duplicate (it is the same as the item before it). Increment Pony's count & decrement numWords

| wordList | • | | numWo | rds 4 |
|----------|-----|-------|-------|-------|
| 0 | 1 | 2 | 3 | 4 |
| Bear | Cat | Horse | Pony | Pony |
| 1 | 1 | 1 | 2 | 1 |

In Use Not In Use

 2
 3
 4

 Bear
 Cat
 Dog
 Horse
 Pony

 2
 1
 1
 1
 3

Rest of file is read. Only duplicate of word already in array is Horse. Llama and Giraffe can't be added. wordList numWords: 5

| 0 | 1 | 2 | 3 | 4 |
|------|-----|-----|-------|------|
| Bear | Cat | Dog | Horse | Pony |
| 2 | 1 | 1 | 2 | 3 |

Drawings

One more: What if the array doesn't end up full? What if the file ends first?

| Read. | first | five | words |
|-------|-------|------|----------|
| | , | ,,,, | ,, , , , |

| wordList numWords: 5 | | | | rds: 5 |
|----------------------|------|------|------|--------|
| 0 | 1 | 2 | 3 | 4 |
| Horse | Pony | Bear | Pony | Bear |
| 1 | 1 | 1 | 1 | 1 |

Horse Pony Bear Pony Bear Horse Pony Bear

1st Sort: Duplicates handled

| | In Use | | | Not In Use |
|----------|--------|------|-------------|------------|
| 2 | 1 | 2 | 1 | 1 |
| Bear | Horse | Pony | Pony | Bear |
| 0 | 1 | 2 | 3 | 4 |
| wordList | | | numWords: 3 | |

Read next two words

| wordList | | | numWords | : 5 |
|----------|--------|------|----------|------|
| 0 | 1 | 2 | 3 | 4 |
| Bear | Horse | Pony | Horse | Pony |
| 2 | 1 | 2 | 1 | 1 |
| | In Use | | | |

Both values read are duplicates. Why do Horse and Pony change places in the unused section?

wordList numWords: 3

| 0 | 1 | 2 | 3 | 4 |
|--------|-------|------|--------|-------|
| Bear | Horse | Pony | Pony | Horse |
| 2 | 2 | 3 | 1 | 1 |
| In Use | | | Not Ir | ı Use |

Read in final word, Bear

| | In Use | | | Not In Use |
|----------|-------------|------|------|------------|
| 2 | 2 | 3 | 1 | 1 |
| Bear | Horse | Pony | Bear | Horse |
| 0 | 1 | 2 | 3 | 4 |
| wordList | numWords: 4 | | | |

File is done. Since file ended first, instead of processing remaining words in file, run sort/process one last

Bear is found when you check after the normal sort, for a duplicate with the last element. Decrement numWords and increment Bear's counter.

| 0 | 1 | 2 | 3 | 4 | |
